

Function Name

Arguments

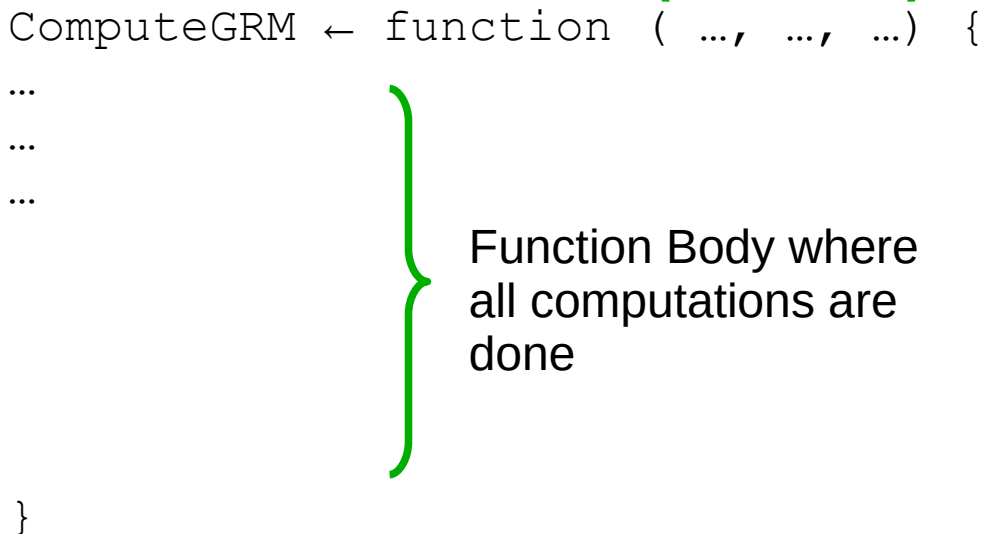

Diagram illustrating the syntax of a function definition in R:

```
ComputeGRM ← function ( ... , ... , ... ) {  
...  
...  
...  
}  
}
```

The diagram uses green annotations to identify parts of the function definition:

- A green arrow points from the text "Function Name" to the variable `ComputeGRM`.
- A green bracket above the parentheses groups the arguments `( ... , ... , ... )`, with the label "Arguments" above it.
- A large green bracket on the right side groups the lines of code between the opening and closing curly braces, with the text "Function Body where all computations are done" next to it.
